

Social Design Framework v0.8

Nine elements of designing social platforms.

The social design framework can help us identify and understand the characteristics of the social platforms we use or build.

The framework consists of nine interchangeable elements, each one describing a function or aspect of a social platform. Some platforms focus on many of the elements, and others specifically on one or two.

This framework is the continuation of work by others; started by early pioneers such as Jyri Engeström, Matt Webb and Jack Schulze, formalised in academia by Kietzmann, Hermkens, McCarthy & Silvestre, and used by analysts in the honeycomb model. There are likely more people out there giving language to this space – and if you know of any, get in touch.
